Annadata

Food Donation & Distribution Web Application

Because no plate should go empty while food goes to waste.

🎓 Flexi Credit Course Project · 🏫 SIT, Pune · 👥 Abel · Aashray · Abhishek · Aatharv · 📅 22 Oct 2026

1 Title of the Project

Annadata – Food Donation & Distribution Web Application. *Annadata* means “the giver of food”. One website where donors, NGOs and an admin meet to move surplus food to the people – and animals – who need it.

2 Motivation for Selection of the Topic

> **The problem is not too little food. It is too little coordination.**

Bakeries, caterers, canteens and function halls throw away good food daily, while orphanages, old-age homes, shelters and street animals go short. Donors don’t know who needs what; NGOs don’t know what’s nearby before it spoils; and in a flood, every hour of delay hurts.

We picked it because it is **real**, it is **local** (annadanam is part of everyday life here), and it needs a full web stack, so one system shows **HTML, CSS and JavaScript** working together.

3 Objectives of the Project

📝 **Post in a minute**
Quantity, category, expiry and source for every donation.

🤝 **Claim → Accept → Done**
Track each donation from available to completed, with expiry alerts.

🚨 **Emergency channel**
Critical / high / medium requests so urgent needs show first.

📅 **Daily distribution**
Places and a Monday–Sunday schedule, dog-food service included.

📊 **Admin insight**
Donations by source, monthly trend, user control.

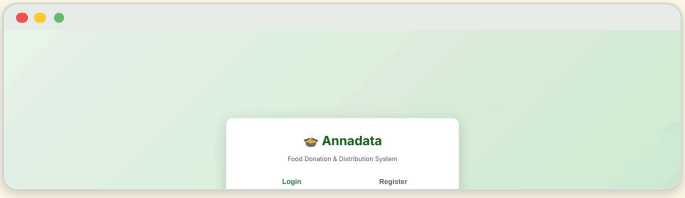

🔐 **Secure & complete**
HTML/CSS/JS front end, Java + MySQL back end, BCrypt login, roles.

4 Customer Base / Target Users

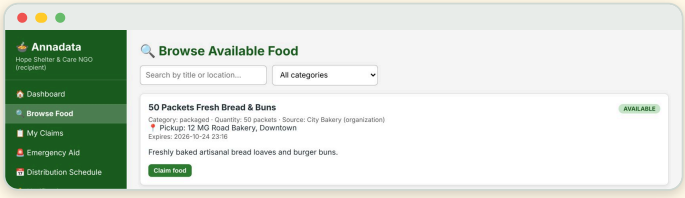

🍞 **Donors**
Restaurants, bakeries, caterers, hostels, households, companies, government relief bodies.

🏠 **Recipients**
NGOs, shelters, old-age homes, orphanages, temples, schools, hospitals, animal-feeding groups.

🧑‍💼 **Admin**
The coordinator who manages users, places, schedule and watches the numbers.

Login & register – the front door

Recipients browse & claim food

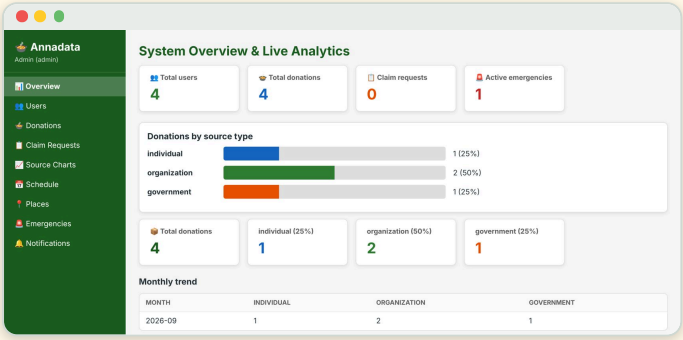

5 Summary of the Project

Annadata is a working web app with **three role dashboards**. The pages are built with **HTML, CSS and JavaScript**; JavaScript talks to a lightweight **Java** server, which saves everything in **MySQL**. We first built it as a JavaFX desktop app, then re-engineered it for the web, reusing the same data layer.

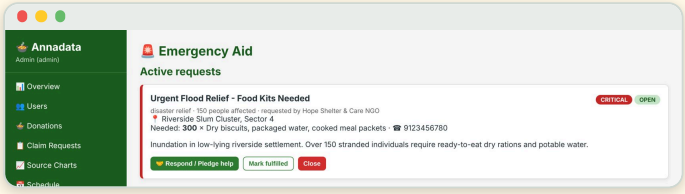

Browser HTML · CSS · JS → fetch() JSON /api/... → Java server routes · roles → DAO · JDBC BCrypt → MySQL 7 core tables

3	35	22	~1,850
user roles	API endpoints	screens tested	lines of web code

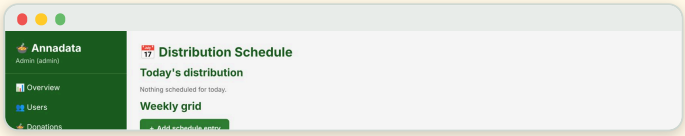

HTML5 · CSS3 · Flexbox · Grid · JavaScript (fetch, DOM) · Java HTTP server · MySQL · JDBC · BCrypt

Admin overview – live totals, source bars, monthly trend

Emergency aid – critical request with "Pledge help"

Weekly distribution schedule

What works & who built it

Tested end to end: donor posts → recipient claims → donor accepts → recipient is notified and sees *accepted*; plus emergency pledges, schedule and analytics. **Next:** SMS / e-mail alerts, map pickup, mobile app.
